

BUILDING E&P National Data Repository in INDIA

A.K.Tyagi

General Manager

Indian School of Petroleum & Energy (ISPe)

Introduction

1. Upstream industry data & information management challenges
2. Can NDR help to resolve them?
3. Key issues to address during NDR designing phase
4. Possible Roles & responsibilities of Stakeholders during NDR Development
5. NDR Design Options
6. Digital Centre Evolution
7. NDC in Digital Age
8. Summary & Conclusion

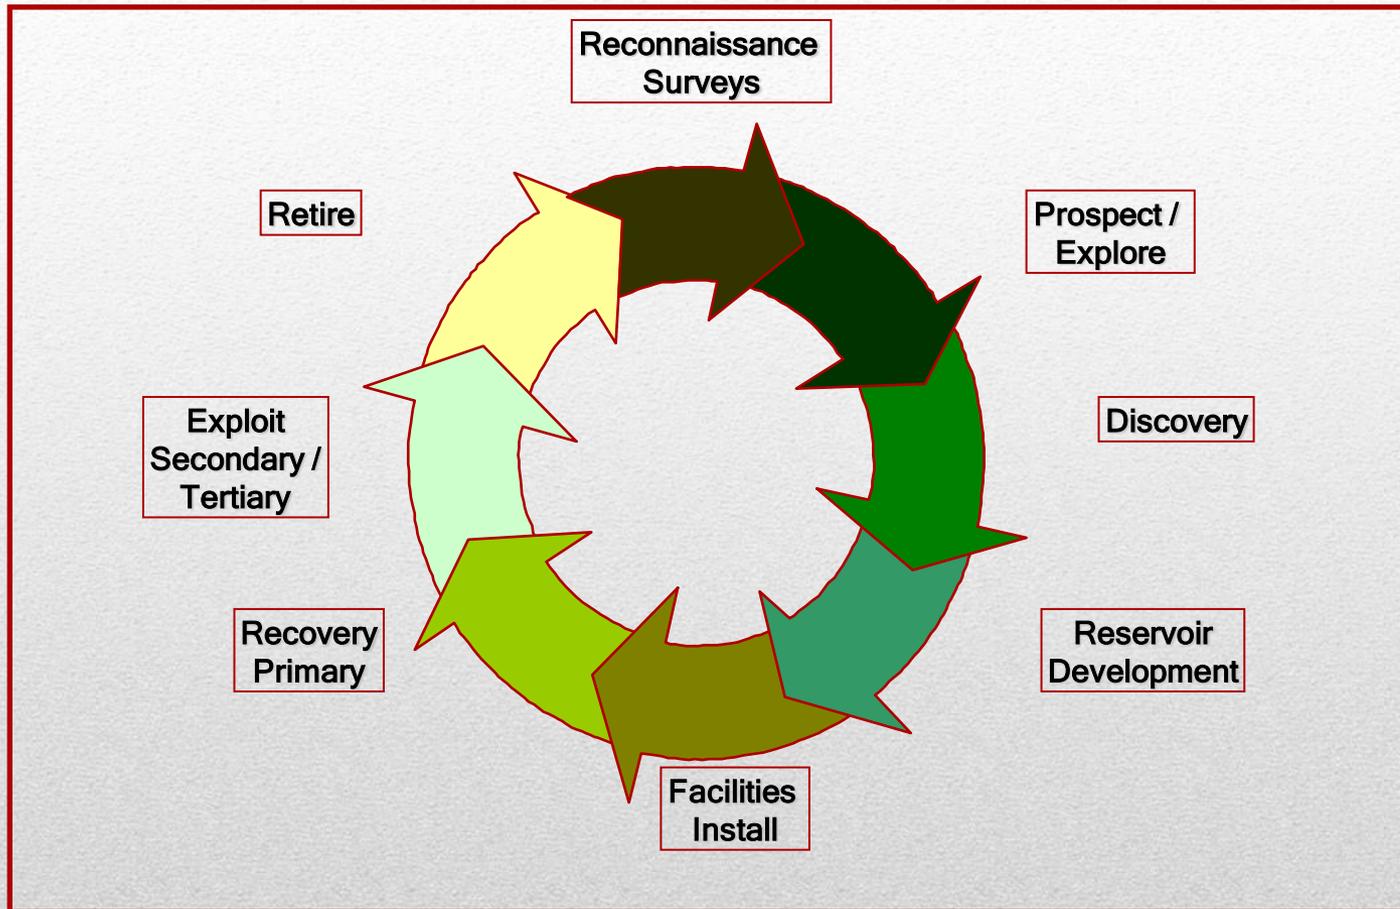

Data - Most Vital Asset

“The value of our company is based on its reserves, its barrels of oil equivalent. They are all ‘virtual.’ We cannot count them, they are a projection of our data. Which really are our assets -- barrels of oil equivalent or data describing the barrels we think we have?”

“Quiet Revolution,” CERA, 1996

I don't think, you can do today's jobs with yesterday's methods & be in businesses tomorrow

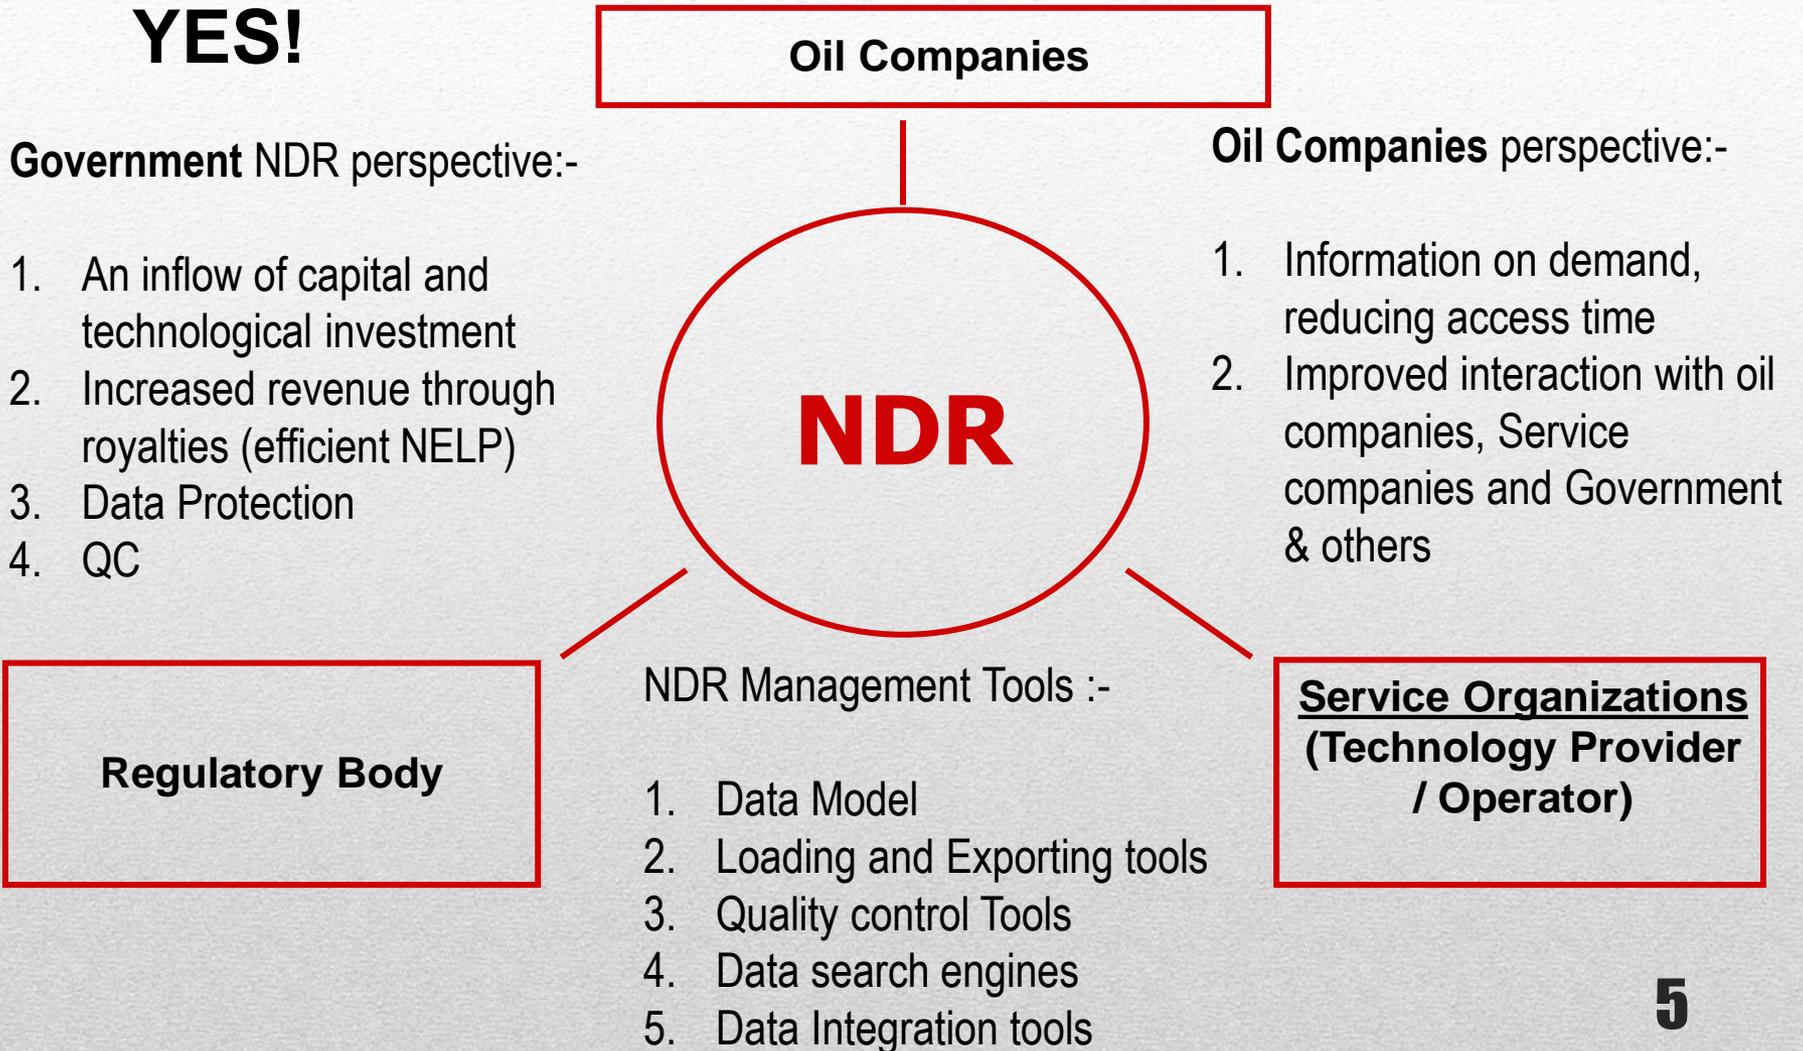

1. Oil Field Data Life Cycle & Phases

Every Cycle Generates Huge Volumes of Data, Information and Interpretation Layers

2. Can NDR Help Resolve These Challenges?

YES!

3. NDR – Key issues of Design Phase

- Indian government / Regulatory body objectives?
- Indian upstream industry objectives?
- Financing the initiative?
- What is required to build a long-term sustainable solution in the Indian context?
- Phase wise design/Implementation
- Will the NDR be government or service company or consortium operated?
- Oil companies expects to proactively use the NDR and not only report data into it?
- Meta data only model?

3. (contd.) NDR – What is critical success criteria?

- Operating Oil Companies perspectives to be borne in mind
- Oil companies realization that data is a National Asset
- Data, the most important asset of oil companies must be shared at mutually worked out cost model
- Current Intellectual Data may not be needed at NDR
- Cost Committee: Govt Rep + Oil Co Rep + Service provider Rep + independent upstream financial institution
- Security Framework Workgroup
- Data Model, Data Flow & Work Flows and QC Council
- NDR Apex Advisory Group
- NDR Operating Group

4. Role & Responsibilities of the NDR Stake Holders (in India)

- Consensus on legal, data security, commercial framework and on operational & technical framework for the NDR
- Define own data management solution within the context of the NDR
- Use NDR as hub for all data sharing
 - concept of one source for all data in a gradually
- Timely reporting/submission cycle of data to NDR operator
- QC of "own" operator stakeholder data in NDR
- Robust Financing model
- DISKOS Norway, (NPD) and - CDA, UK, (DTI) & other best practices
- Standards Development, participation process
- Use WITSML, ProdML, GUWI, PWLS and RESQML products of Energistics in their present form in the India-NDR

4. (contd.) Possible Regulatory Role

- Provide legislation and regulation as foundation for NDR
- Play leading role in building consensus in defining standards and guidelines for NDR use
 - Define reporting schedules & deadlines
 - Define reporting standards (Energistics, UKOOA, PPDM,....)
 - Define routines for release of public data
 - Define phased components and deliverables
- Push oil companies for joining NDR showcasing mutual gains + possible tax reliefs for NDR participation & support.
- Provide financial incentives to oil companies for NDR participation
 - Tax relief can be implemented in Production Sharing Agreements or License Work Programmes (if feasible)

4. (contd.) Role of the Service Organizations

- Build consensus for finalizing technology and processes for efficient QC, storage, retrieval and distribution of NDR data
- Develop procedures for data handling in accordance with government regulations
- Provide service level understanding in accordance with agreed version
 - Cater to core needs as defined by oil company consort
 - Provide specific needs of oil companies beyond the level defined by industry consortium
if required

5. NDR Design Options / Models

Model-I

Govt Initiated,
Dictated & driven
model

(Compliance Model)

- Negligible use by operating oil companies
- Basically meant to provide public domain data for licensing rounds
- Government and / or service company operated

Model-II

Govt initiated, oil cos.
Supported model
(Sharing Model)

- Some use by operating oil companies
- Used for data sharing between production licenses/PSAs as well as access to public data
- Service company operated

Model-III

Oil Consortium and
govt driven (Hub
Environment)

- Commitment of oil companies
- Prolific use by all E&P players
- Replicate Company's own data management solutions
- Service company operated
- Can work as a disaster recovery solution

Model-IV

Meta-Data Model
(Preferred)

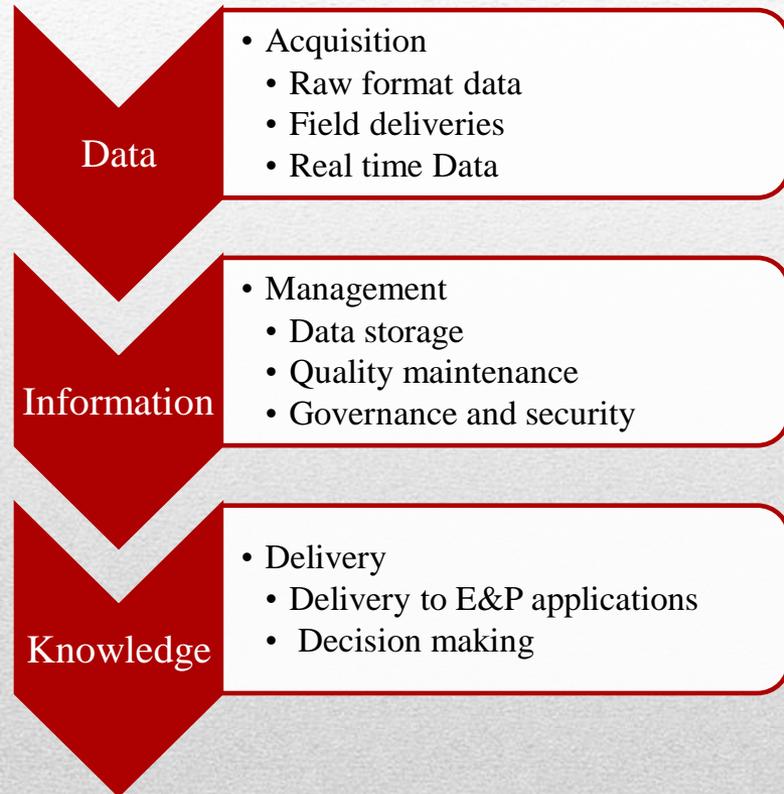

- Meta-data only resides in NDR
- Bulk data remains with parent company / on demand sharing
- Data selection through Meta-data navigation at DGH or through World Wide Web
- All Oil companies linked to NDR through Secured WAN Protocols
- Security issues comparatively less
- Ownership remains with parent company
- Can start quickly

Data Centre Evolution

NDC in Digital Age

- Data Management platform is key enabler
- Online services are critical
 - Configurable to meet your needs
 - Automation delivery efficiencies
 - Control maintenance
 - Flexible service and business model

6. Summary & Conclusions

- While designing India's National Data Repository:
 - Approach and build consensus within stakeholders keeping their data centric and commercial meaning intact.
 - Carefully determine the objectives for the NDR (Archive or Data sharing hub)
 - Who is going to finance the initiative (Government or Govt + Industry or Industry consortium)?
 - Brainstorm & Consider the alternative NDR models and decide which one is best suited to fit the nation's needs; Keeping in view oil companies business interests and ease of implementation.
 - Attempt leveraging meta-data model to ensure simplicity of operations and avoiding multilevel replications to begin with
 - Analyze with a clear purpose what the service industry, regulatory body and oil companies have to offer in the entire process.
